ABSTRACT:

PURPOSE: To aim at the thoroughness of room entrance control by setting up a memory storing only those of holyday attendance appointed persons, a calendar circuit, a timer or the like in a room entrance controller for unlocking an electric lock by means of an identification card, etc., thereby making only those who have preregistered of it enterable into a specific area in the holyday.

CONSTITUTION: This controller is provided with a memory 5 storing those of holyday attendance appointed persons in addition to another memory storing room entrance objects in a workday, and both these memories are selected by a calendar circuit 12. Next, a person who has submitted notice in advance inserts his card 3 into a card reader 4, and when it accords with the content of the memory 5, an electric lock 2 is unlocked, so he enters a specific area. In addition, a timer 16 is set up there, through which, for example, after that at 5 p.m. in the holyday, even those who have submitted a holyday attendance notice are made so as not to enter the room. In addition, names, personnel numbers, each entrance time or the like of the holyday entrant people are all recorded. With this constitution, entrance control in the holyday or the like can be done accurately.
